Managing and Leading Conservation Projects

£400

**Fauna
& Flora**
Saving Nature Together

“Leadership is arguably the most important attribute in the tool kit of a conservation biologist”

– Dietz et al, 2004

Successful scientists often find themselves in leadership roles within projects and organisations but can lack the management training to enable them to achieve their greatest potential. This five-week course offers conservation practitioners an introduction to management and leadership training within the context of wildlife conservation.

Delivery

Online learners join a world-wide community of peers. Training is delivered through a series of presentations, background reading material, individual assessments and online discussion boards. The accessible and interactive format and part-time delivery allows learners to fit study around work and life commitments.

Collaboration

Fauna and Flora has a proven track record in managing the recovery of species and systems while balancing the needs of people’s lives and livelihoods. Working in partnership with Fauna and Flora, we can draw on a collective network of senior conservation leaders from across the sector to offer learners a real-world context to their learning.
