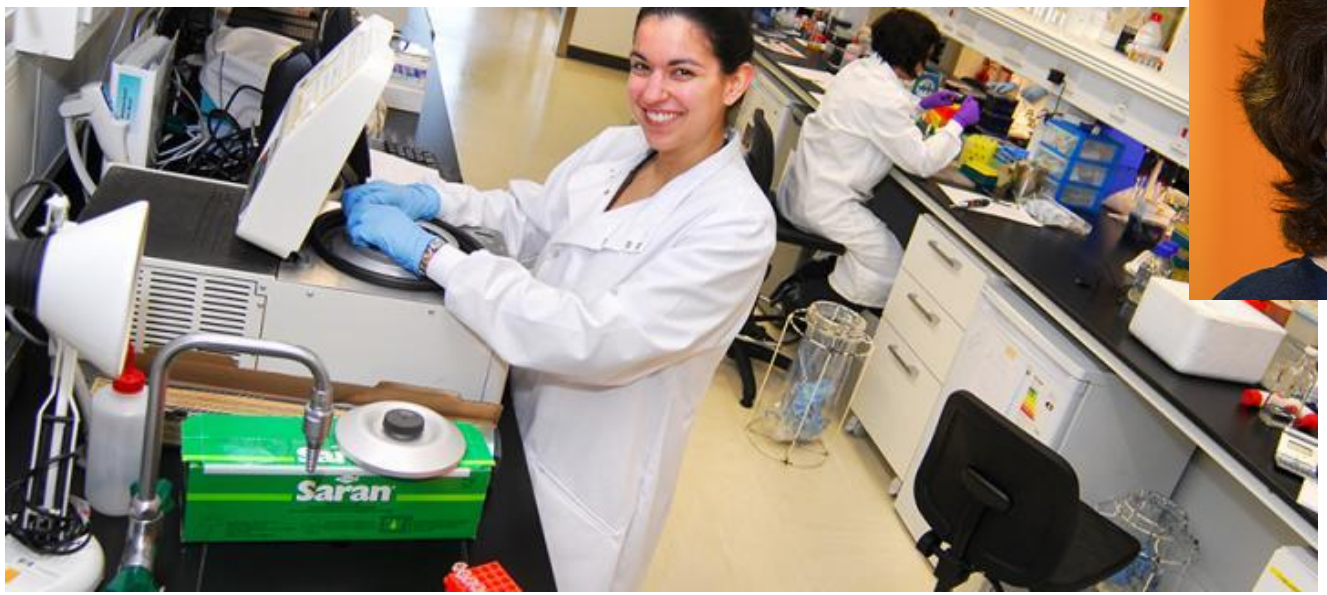
Bird Flu in Research in Roslin



Helen Sang

GM chickens that don't transmit bird flu developed

Breakthrough could prevent future bird flu epidemics

Chickens genetically modified to prevent them spreading bird flu have been produced by researchers at The Roslin Institute of the University of Edinburgh and the University of Cambridge.

The scientists have successfully developed genetically modified (transgenic) chickens that do not transmit avian influenza virus to other chickens with which they are in contact. This genetic modification has the potential to stop bird flu outbreaks spreading within poultry flocks. This would not only protect the health of domestic poultry but could also reduce the risk of bird flu epidemics leading to new flu virus epidemics in the human population.

The study, funded by the Biotechnology and Biological Sciences Research Council (BBSRC), is published today in the journal Science. A list of questions and answers together with downloadable images is available.

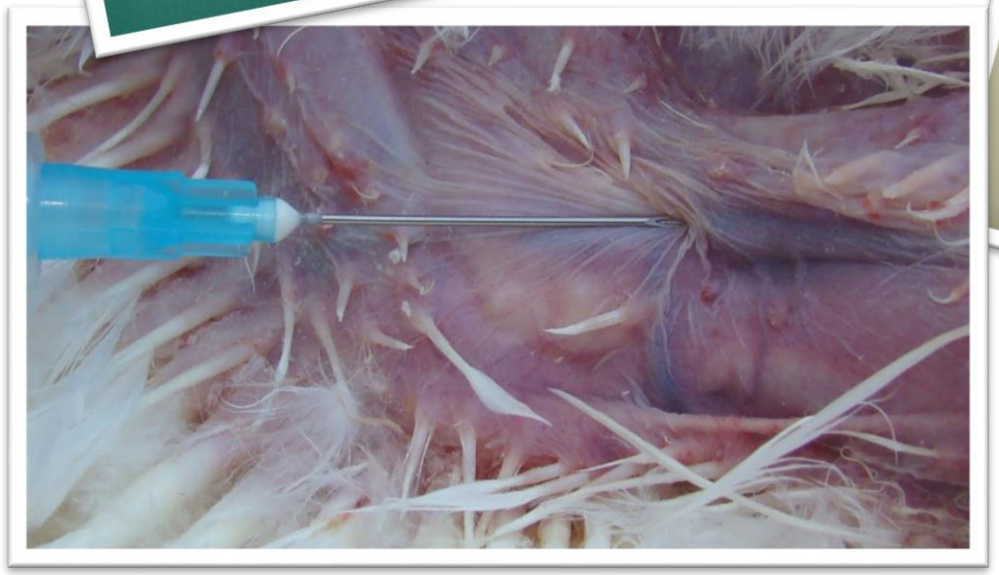
Today's workshop- Bird Flu Outbreak

The aim of today's workshop

Analyse chicken blood samples from farms A – D to find out if they have been infected by the flu virus

Blood samples were taken from chickens on farms A - D

Taking a blood sample



Obtain a pure serum sample from 4 chickens

Chicken blood sample from

Farm A 
Farm B 
Farm C 
Farm D 

1) Spin the tubes in the centrifuge for 1 minute.

Centrifuge spins tubes at 14,000 revolutions per minute (rpm) for 2 minutes

Heavier material (the cells) is thrown outwards and collects to form a **pellet**

Liquid

Pellet

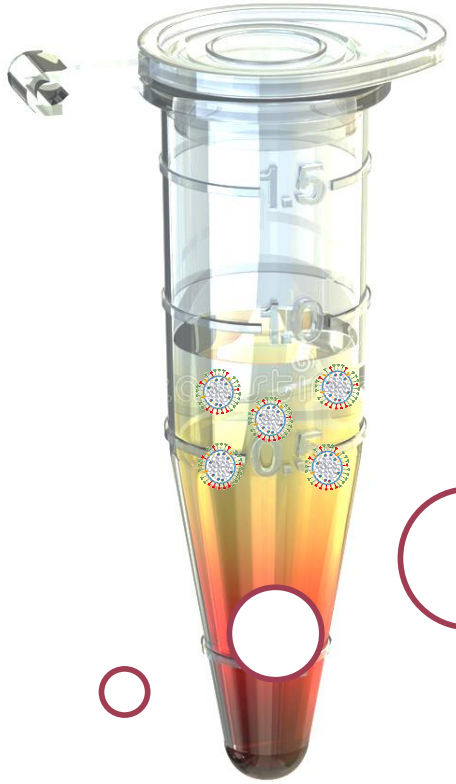
Serum- the liquid part of blood



What technique can we use to detect virus in the serum?

The liquid part of blood that will contain flu viruses in infected animals

The method - how do you detect influenza virus in chickens?

Use a laboratory technique called an ELISA

Today's experiment

Create a **standard curve** using known **flu antigen** concentrations

Test serum samples from chickens on farms A, B, C & D for presence of flu virus antigen

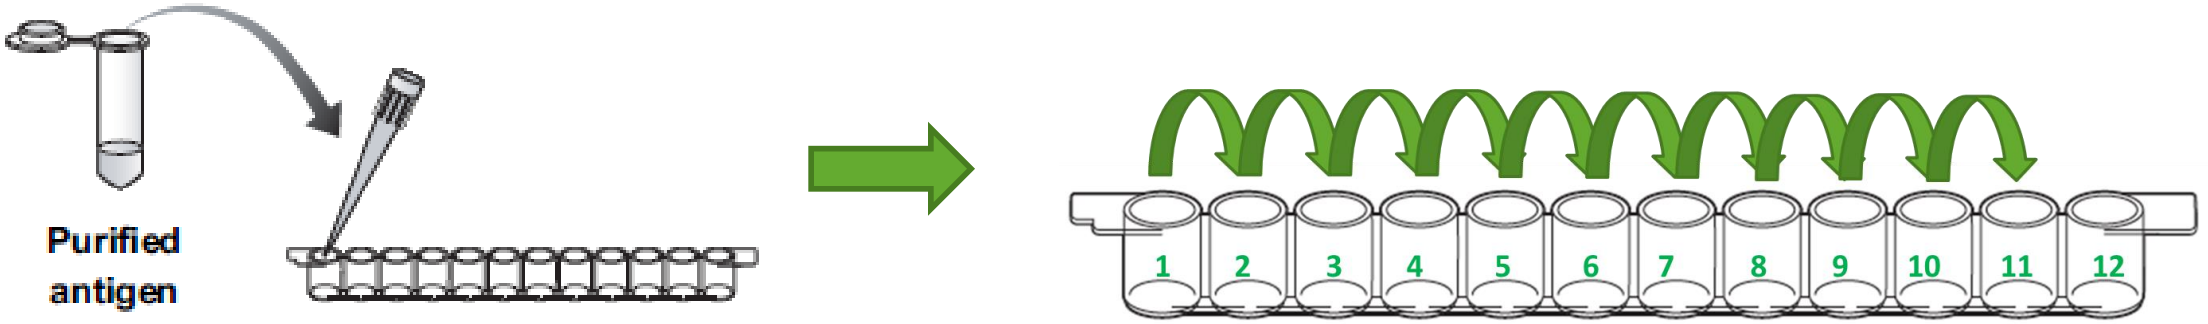
Safety first!

THE UNIVERSITY of EDINBURGH
Easter Bush
Science Outreach Centre

Get hands-on with real-life science

How do you create a standard curve?

1. Create a serial dilution of known concentration of flu virus antigen

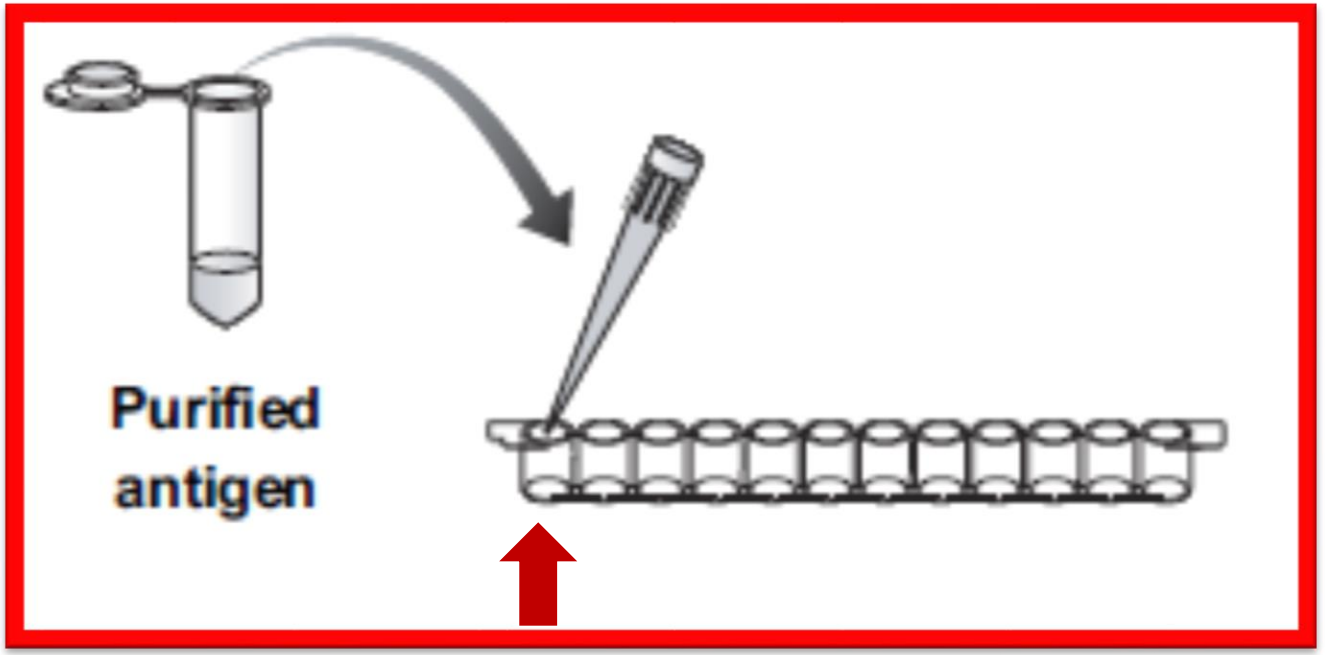


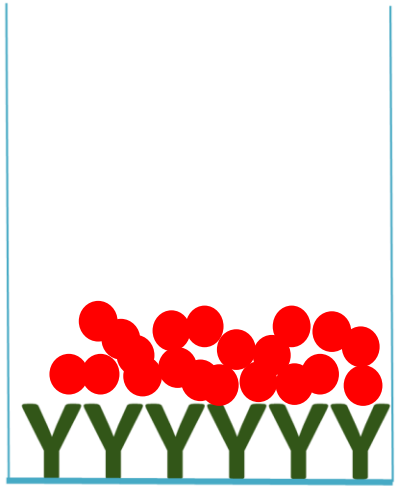
2. Test these samples using the ELISA technique

3. Plot absorbance readings from ELISA against antigen concentration to create standard curve

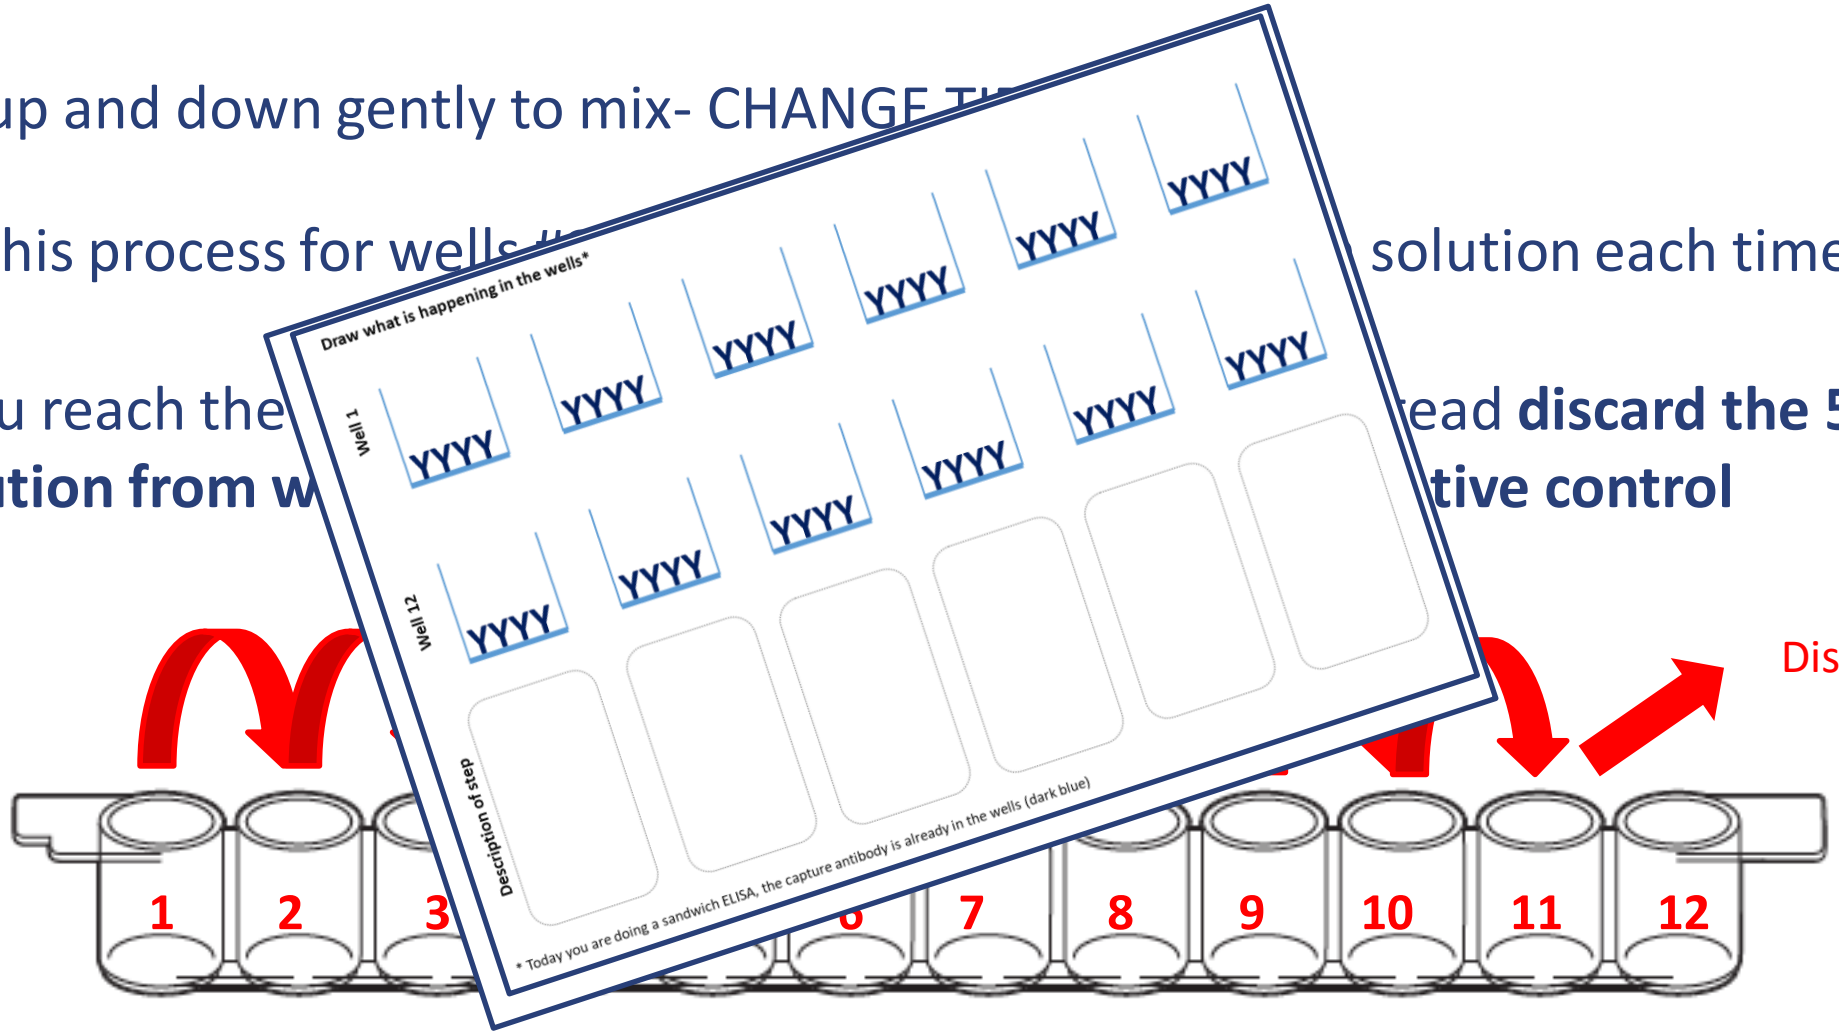
Method – Serial dilution of antigen

1. Label the outside of **one** of your 12-well strips with numbers 1-12
2. Add **50µl PBS** from the tube labelled “PBS” to wells labelled **#2 to #12**
3. Add **100µl antigen** from the red tube to well #1



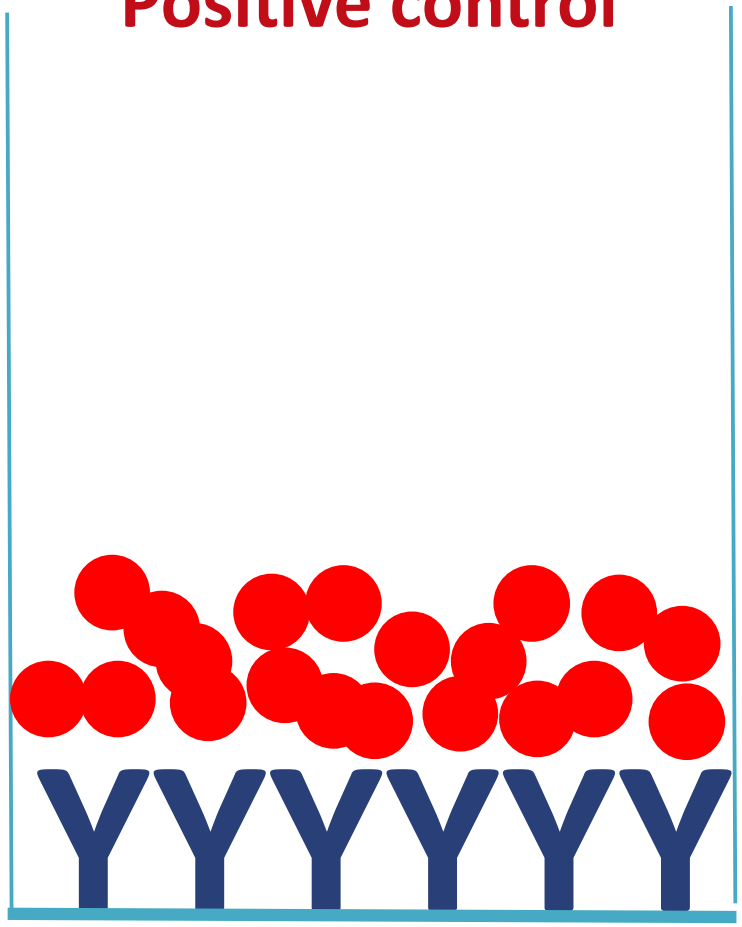


4. Using your pipette, **transfer 50µl antigen** from well #1 and add it to the PBS solution in well #2
5. Pipette up and down gently to mix- CHANGE TI
6. REPEAT this process for wells # solution each time
7. When you reach the ead **discard the 50µl antigen solution from w tive control**



8. Incubate for **5 min** to allow antigen to bind- what is happening in well 1 and 12?

Well 1
Positive control



Well 12
Negative control

antigen

Capture antibody

Primary antibody

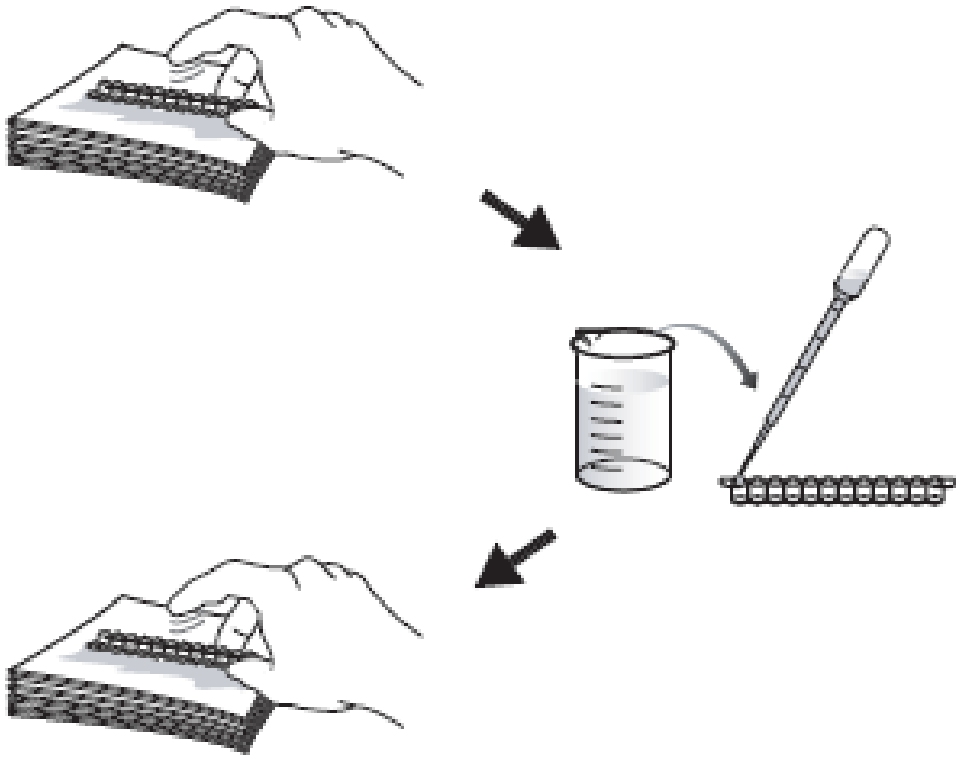
secondary antibody

substrate

THE UNIVERSITY of EDINBURGH
Easter Bush
Science Outreach Centre

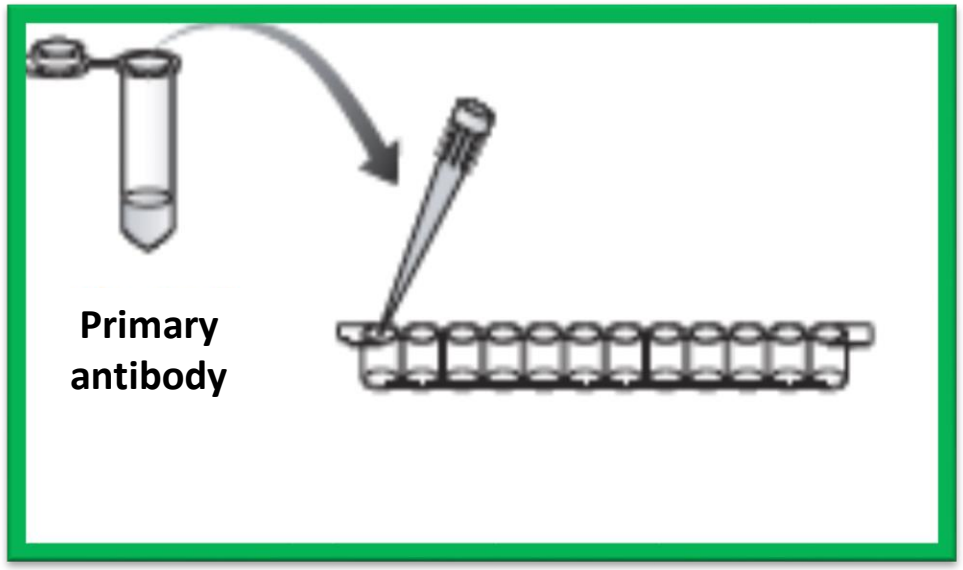
Method – Wash step

1. Tip microplate strip upside down onto paper towel stack and tap to drain wells.
2. Use transfer pipette to **fill each well with wash buffer**
3. Tip microplate strip upside down onto paper towel stack and tap to drain wells.
4. Discard the top 2–3 paper towels.
5. Repeat steps 1 to 4

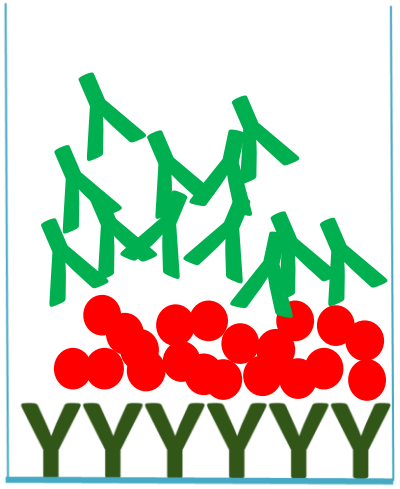


Method – Primary antibody

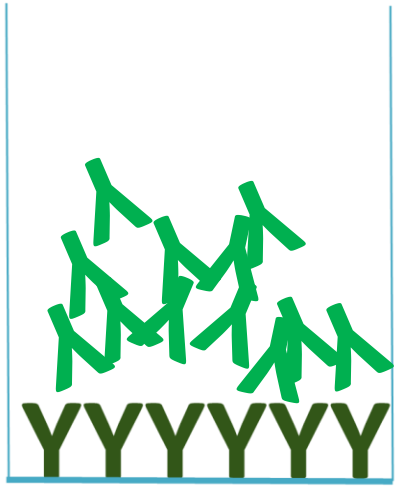
1. Add **50µl primary antibody** from the green tube to all wells
2. Wait for 5 minutes- what is happening in wells 1 and 12?
3. Wash all wells with wash buffer **2 times**



Well 1
Positive control

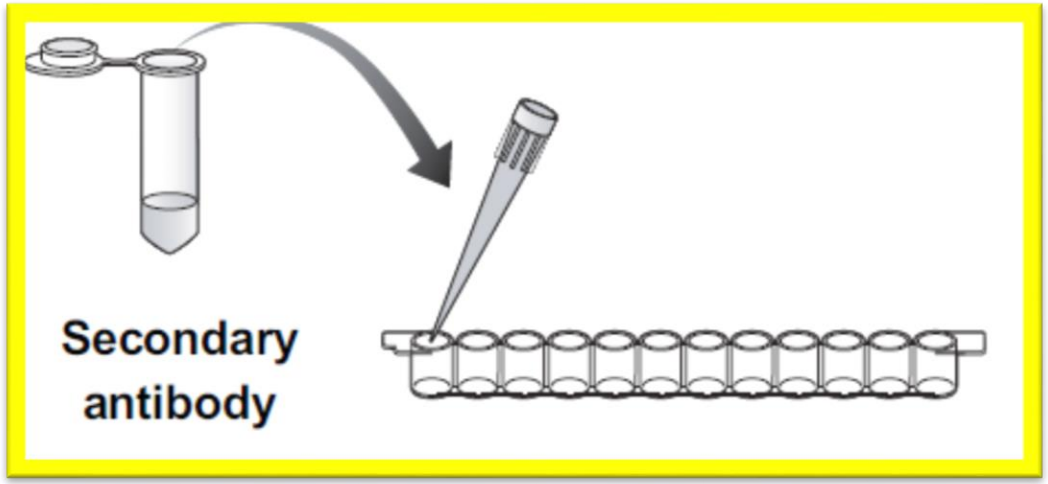


Well 12
Negative control

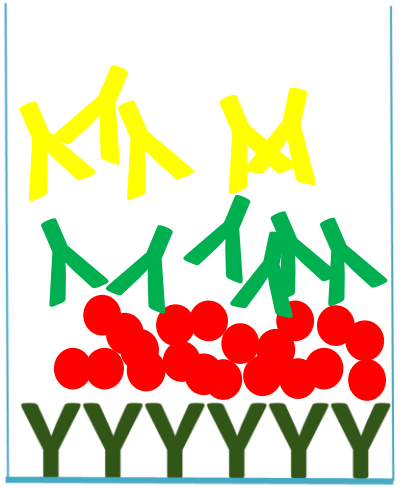


Method – Secondary antibody

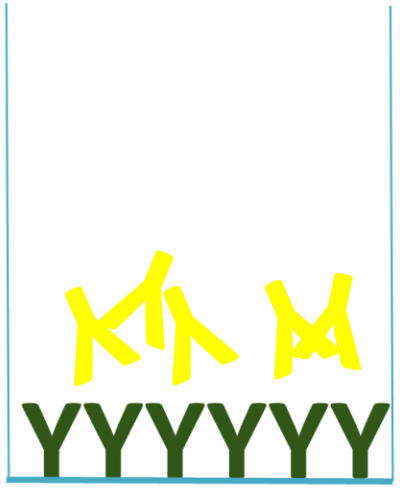
1. Transfer **50µl secondary antibody** from the yellow tube into all 12 wells
2. Wait for 5 minutes- what is happening in wells 1 and 12?
3. Wash all wells with wash buffer **3 times**



Well 1
Positive control

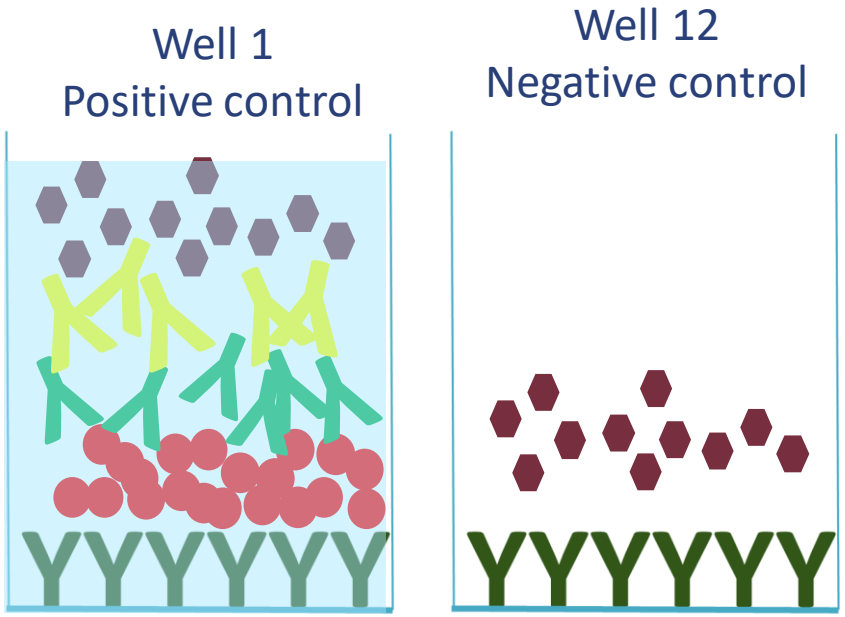


Well 12
Negative control



Method – reporter reaction

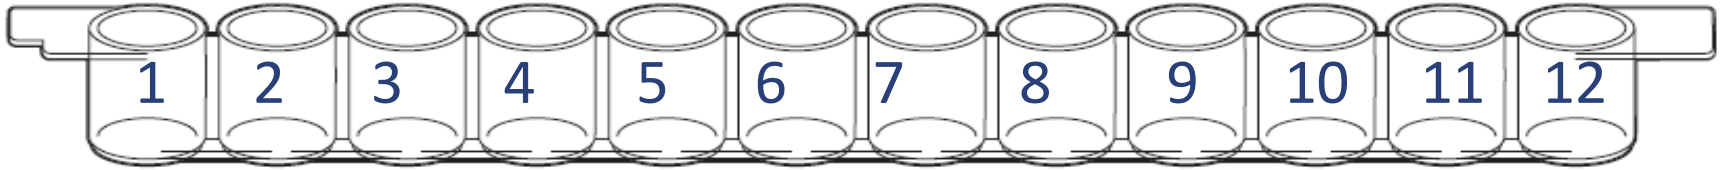
1. Transfer **50µl substrate** from the brown tube into all 12 wells
2. Wait 5 minutes- what is happening in wells 1 and 12?



3. Using a fresh tip add **100µl 0.18M sulphuric acid** to each well **<u>to stop the reaction</u>**

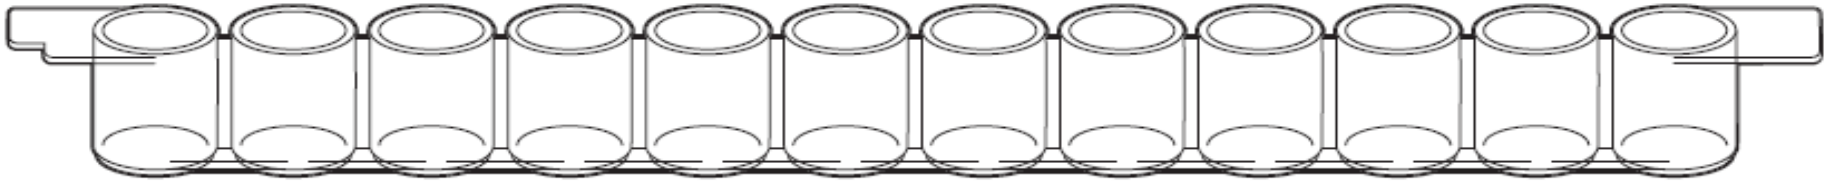
Qualitative Data Analysis Observe the colour change after the acid has been added and rate the colour change on a scale of your choice.

Well numbers:



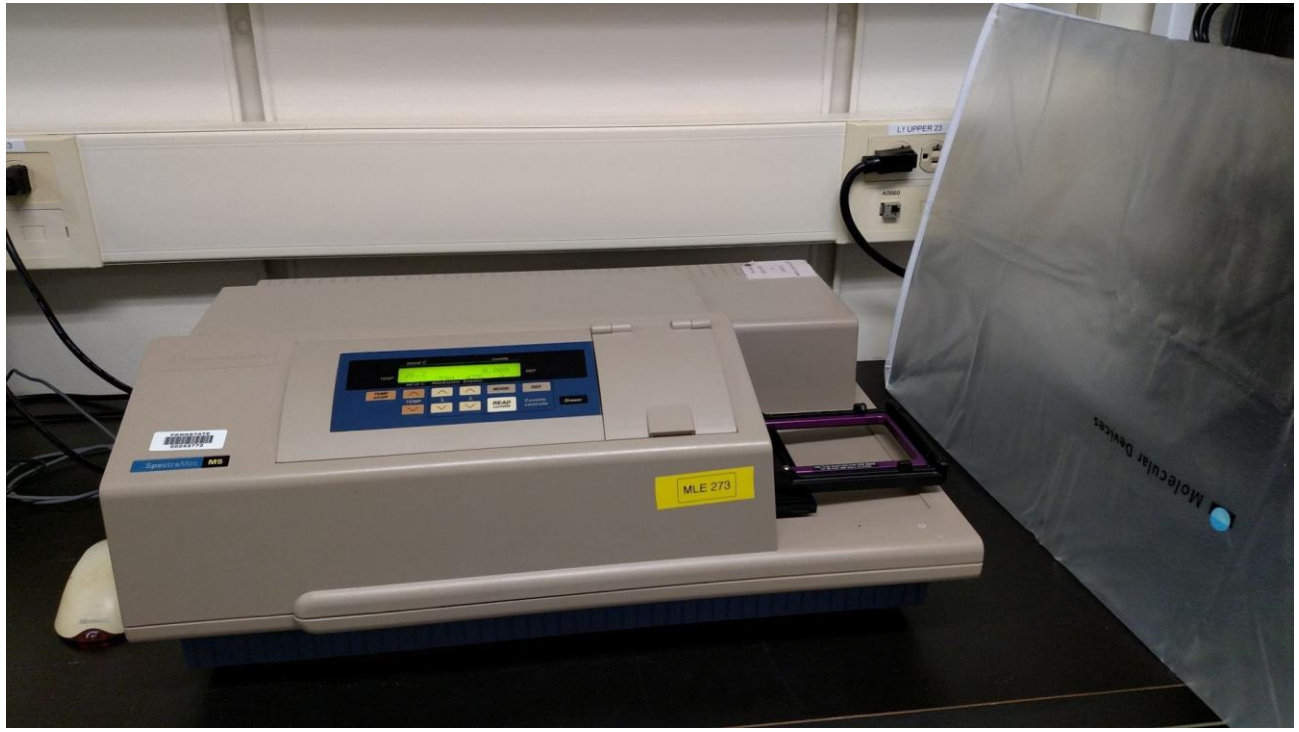
Colour intensity scale:

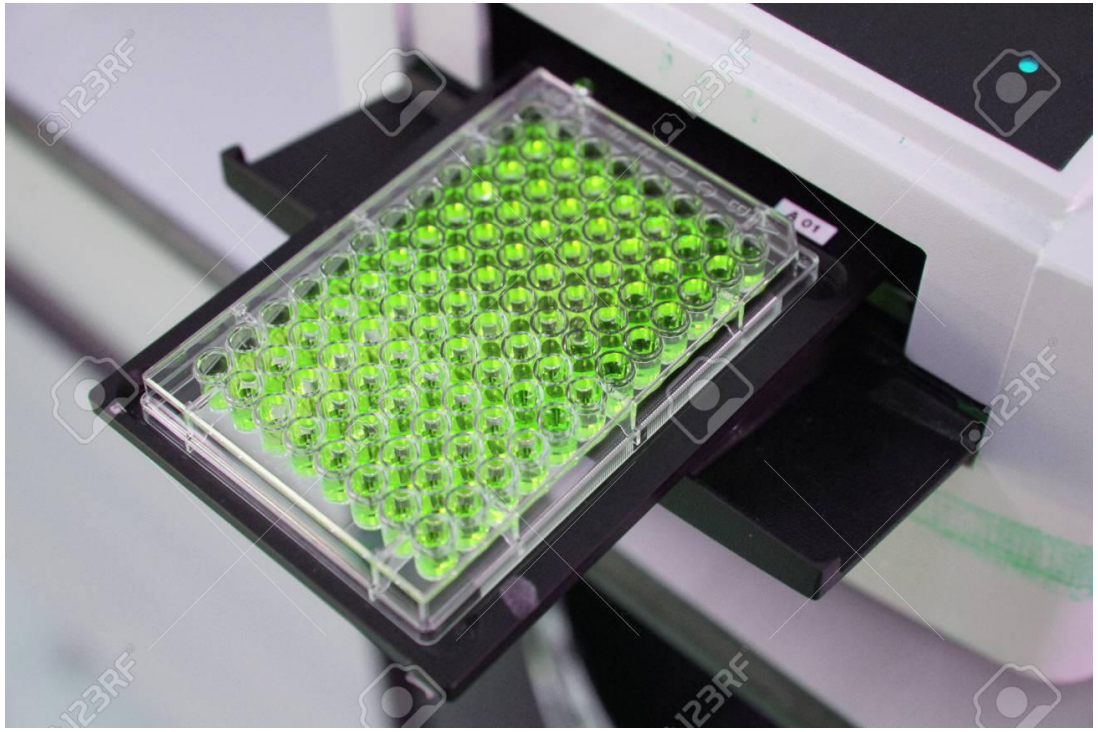
Your scores here:



Notes:

Quantitative Data Analysis Using the data from the plate reader, record the absorbance of your dilution series.





The plate reader will measure the intensity of the yellow colour

-absorbance of each well will be measured at a wavelength of 450nm-

Quantitative Data Analysis

Quantitative data : Using the data from the plate reader, record the absorbance of your dilution series and that of the entire classes. Use the average values to plot a standard curve

Well	1	2	3	4	5	6	7	8	9	10	11	12
Antigen conc. (ng/ml)	1000	500	250	125	62.5	31.3	15.6	7.8	3.9	2	1	0

Data provided on a separate print out

LUNCH

Please be back here for 12:45pm!

So far….

Created a standard curve using known antigen concentrations

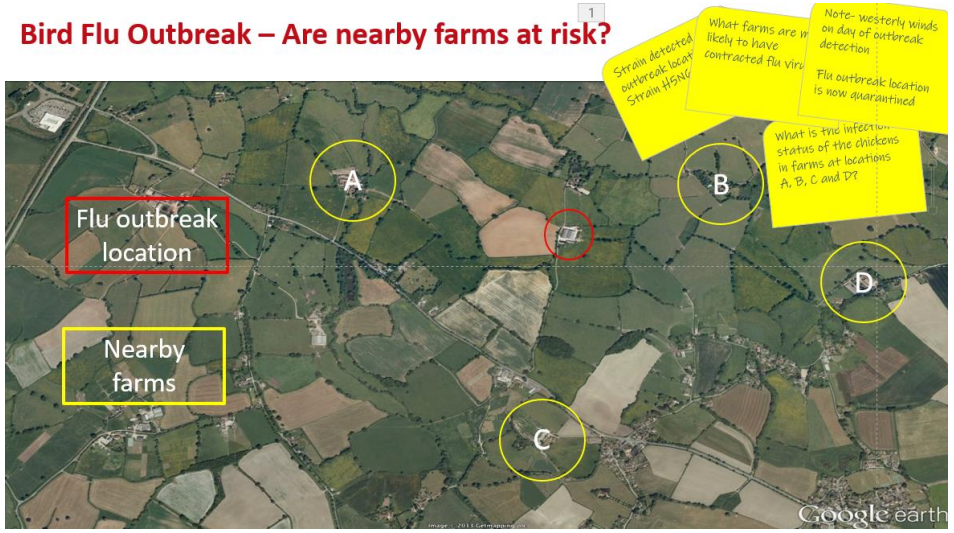
Next…

Test serum samples from chickens on farms A, B, C & D for presence of flu virus antigen

What is your hypothesis?

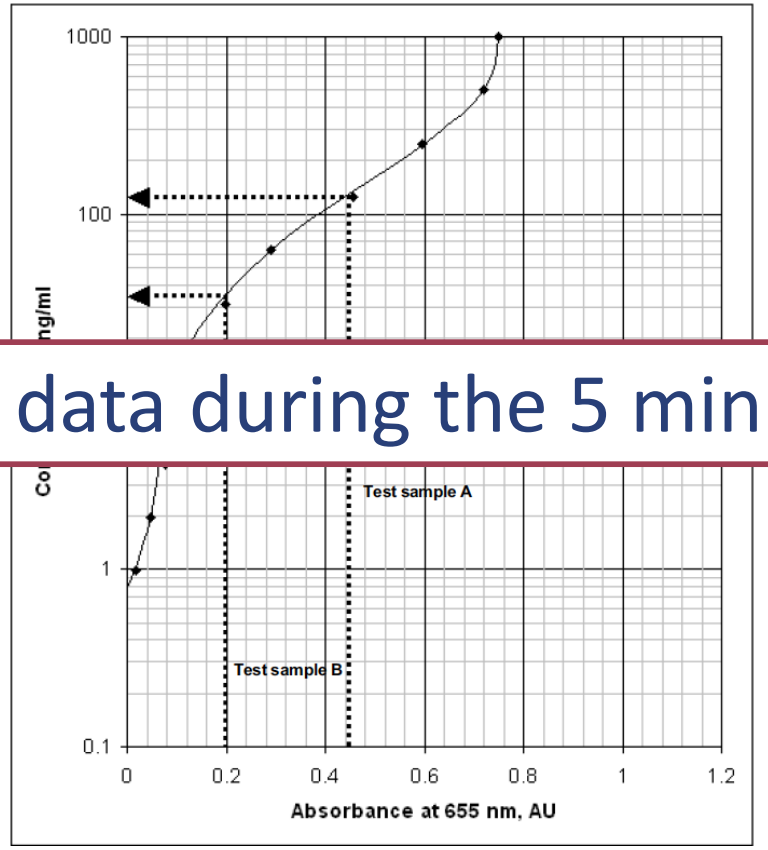
Which of the surrounding farms (A-D) do you think could have infected chickens?

- Analyse the information
- Identify the important evidence
- Write down your hypothesis



Why have we created a standard curve?

- Creating a standard curve using **known** concentrations of flu antigen will allow us to convert the readings from our **unknown** test samples into antigen concentrations



Plot your data during the 5 minute waits

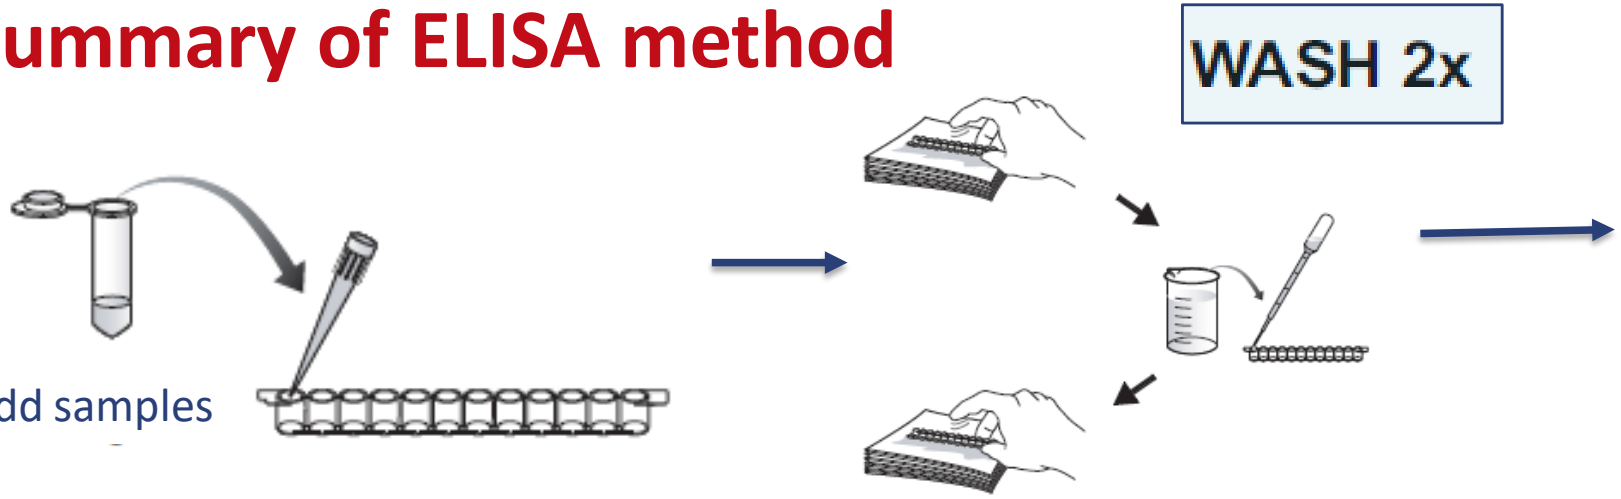
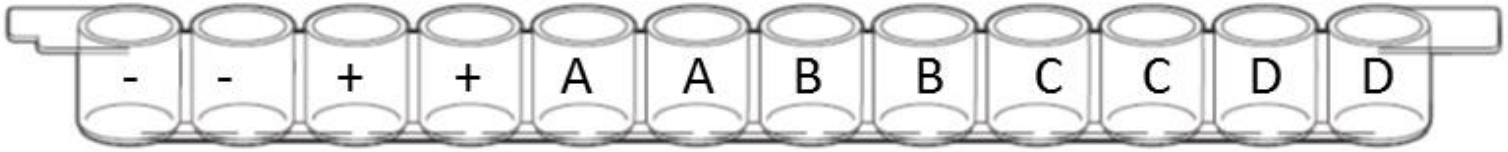
Summary of ELISA method

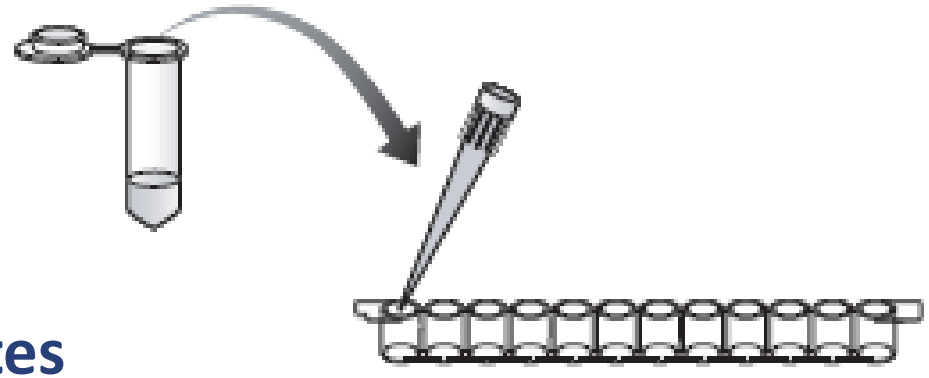


Part 2 – Testing the chicken serum samples

1. Label your second 12-well strip – you will need two wells each for your **negative control**, **positive control** and the **4 farm samples A-D**.



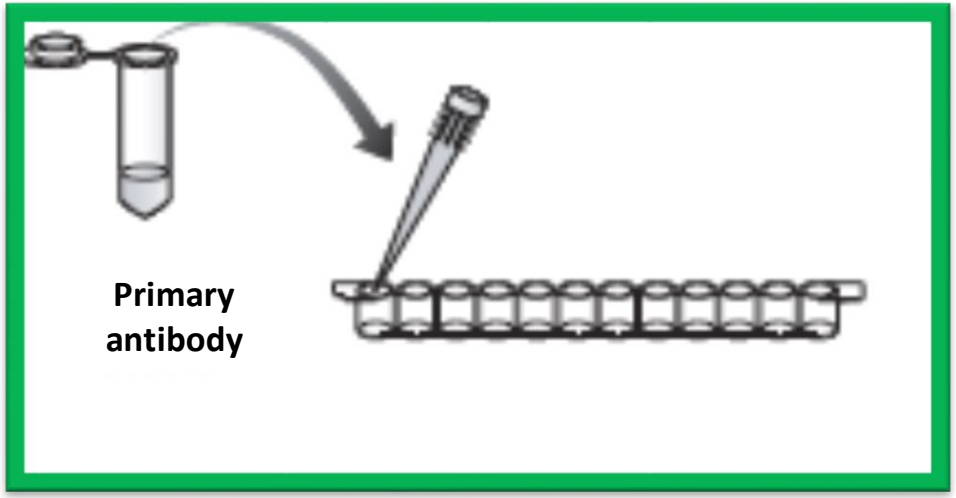
2. Transfer **50µl each sample** into **2 wells** of the microplate strip.



3. Wait for **5 minutes**
4. Wash all wells with wash buffer **2 times**

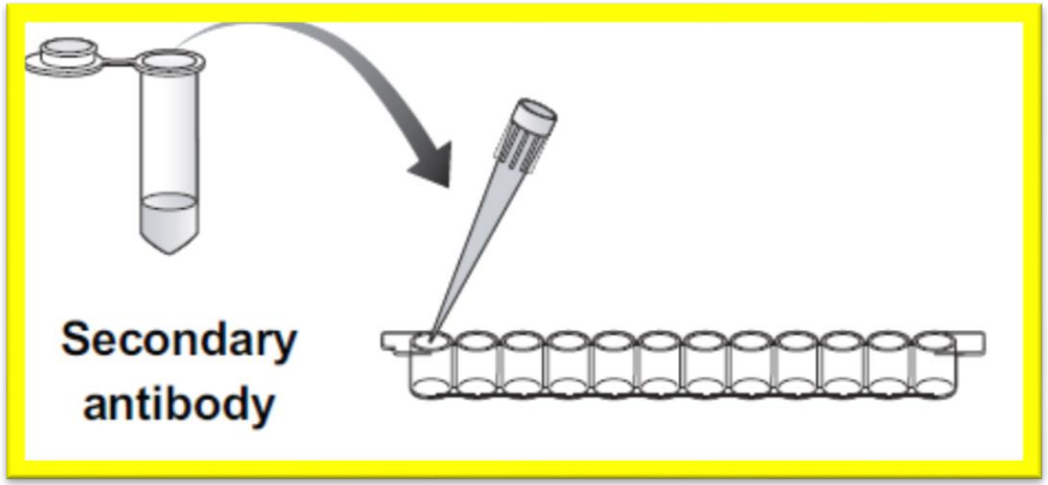
Method – Primary antibody

1. Add **50µl primary antibody** from the green tube to all wells.
2. Incubate for 5 minutes
3. Wash all wells with wash buffer **2 times**



Method – Secondary antibody

1. Transfer **50µl secondary antibody** from the yellow tube into all 12 wells
2. Wait for 5 minutes
3. Wash all wells with wash buffer **3 times**



Method – reporter reaction

1. Transfer **50µl substrate** from the brown tube into all 12 wells

1. Wait 5 minutes

3. Using a fresh tip add **100µl 0.18M sulphuric acid** to each well **to stop the reaction**

Qualitative Data Analysis Observe the colour change after the acid has been added and rate the colour change on a scale of your choice.
